EXP 14: Pro-Code Extension Using Zoho Catalyst

AIM

To study the integration of Zoho Catalyst with the Job Application Management System to extend its functionality using custom code and backend services.

THEORY

Zoho Catalyst is a pro-code development platform that enables developers to build and deploy backend services, APIs, and serverless functions. It extends the capabilities of Zoho Creator by allowing developers to implement advanced business logic and integrate external services.

Key Features:

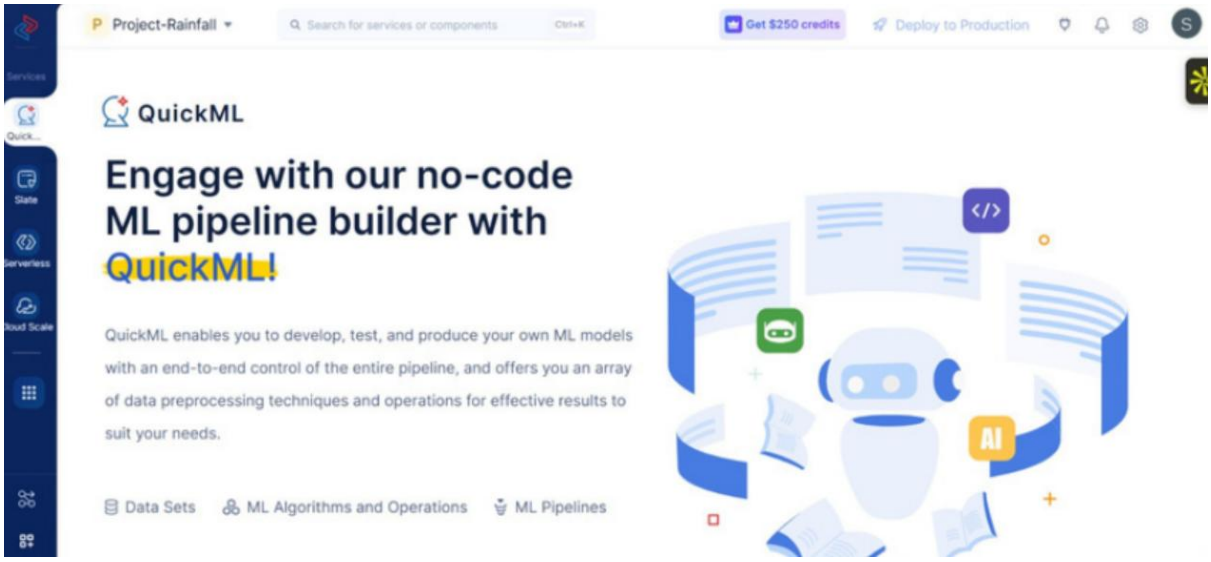

- **Serverless Functions:** Execute custom logic for candidate application validation and recruitment processing.
- **API Integration:** Connect Zoho Creator with external HR systems and third-party services.
- **Data Processing:** Process candidate application records and validate recruitment details.
- **Automation:** Extend existing workflows with custom backend logic.
- **Scalability:** Support application functionality using cloud-based backend services.

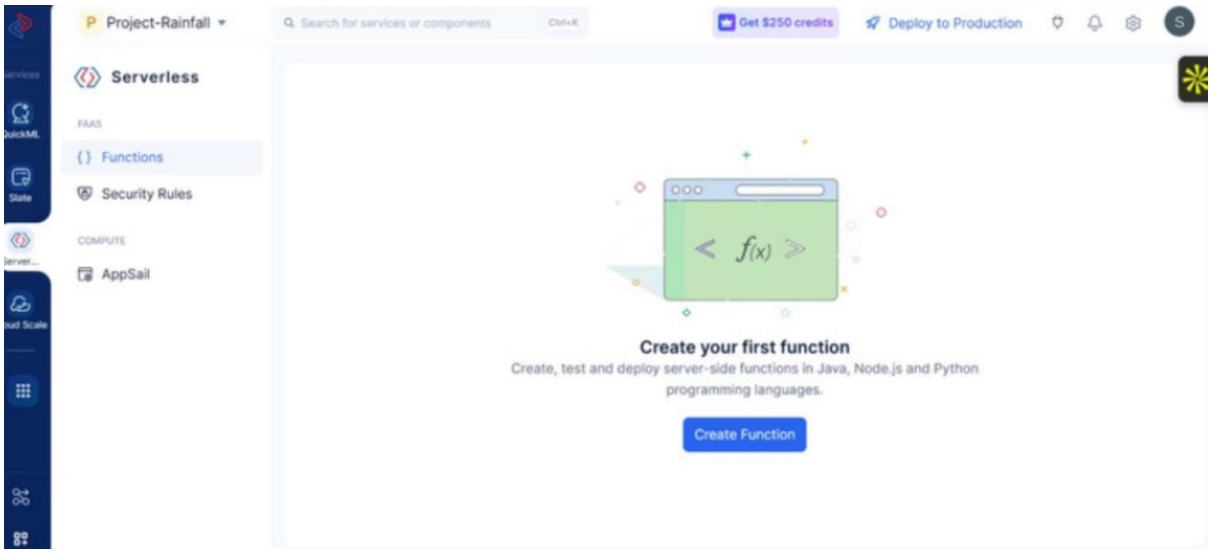

PROCEDURE

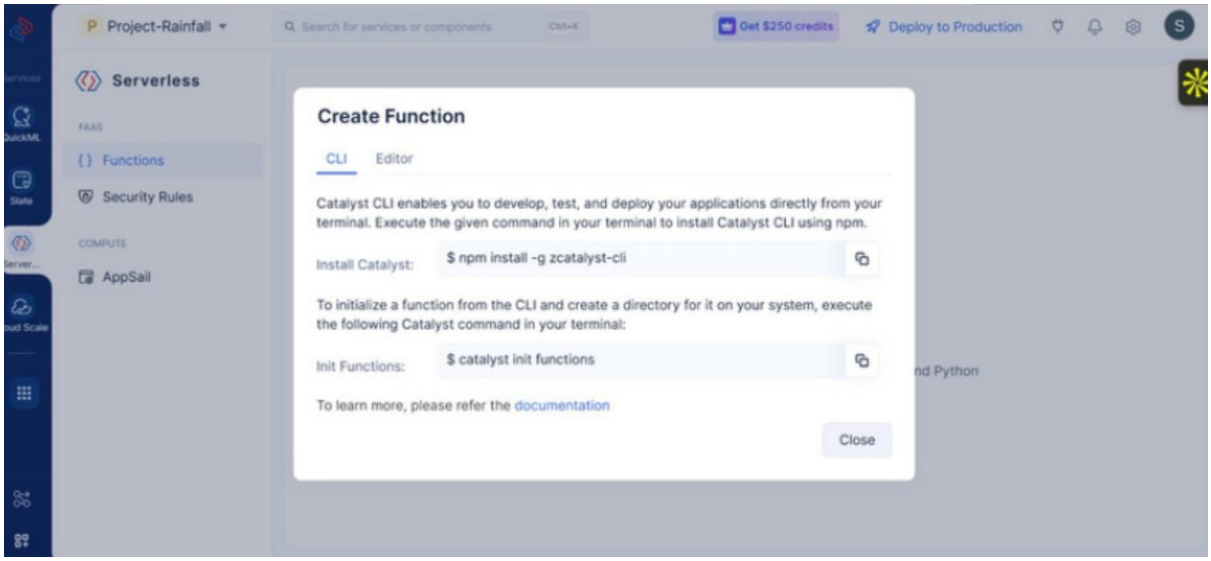

1. Logged in to the Zoho Catalyst platform.
2. Created a Catalyst project named Job Application Project.
3. Opened the Serverless Functions section.
4. Created a serverless function named candidate Application Validator using Node.js 24 and Basic I/O.
5. Implemented custom logic to validate the candidate's name, email address, and job position.
6. Tested the function using sample candidate application details.
7. Verified the function response using the Catalyst Test Console.
8. Obtained the development function URL.

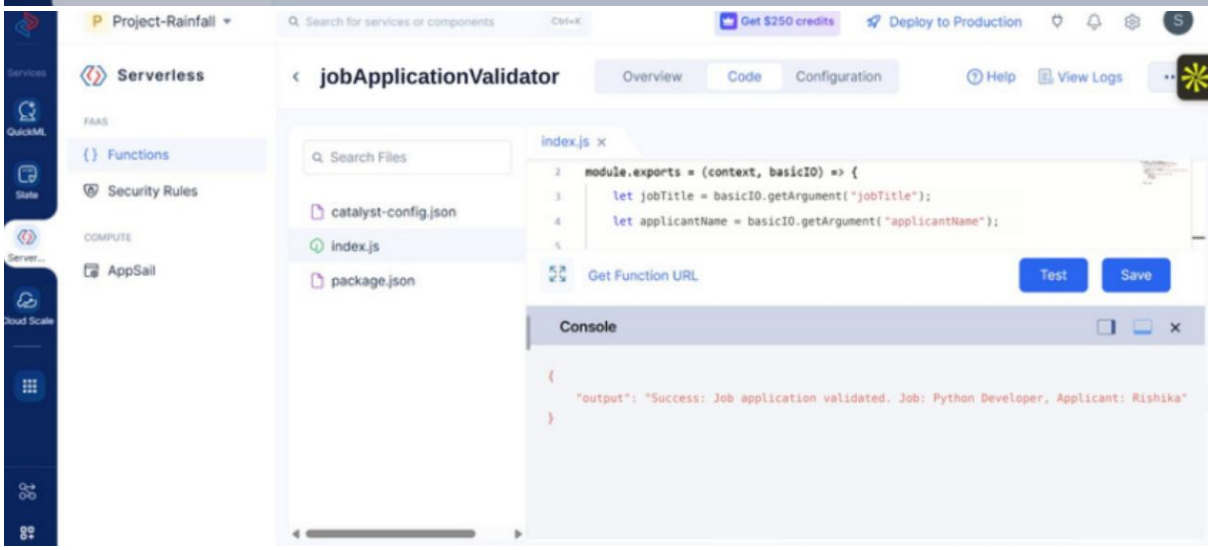

9. Created a workflow named Catalyst Candidate Validation in the Job_Application_Form of Zoho Creator.

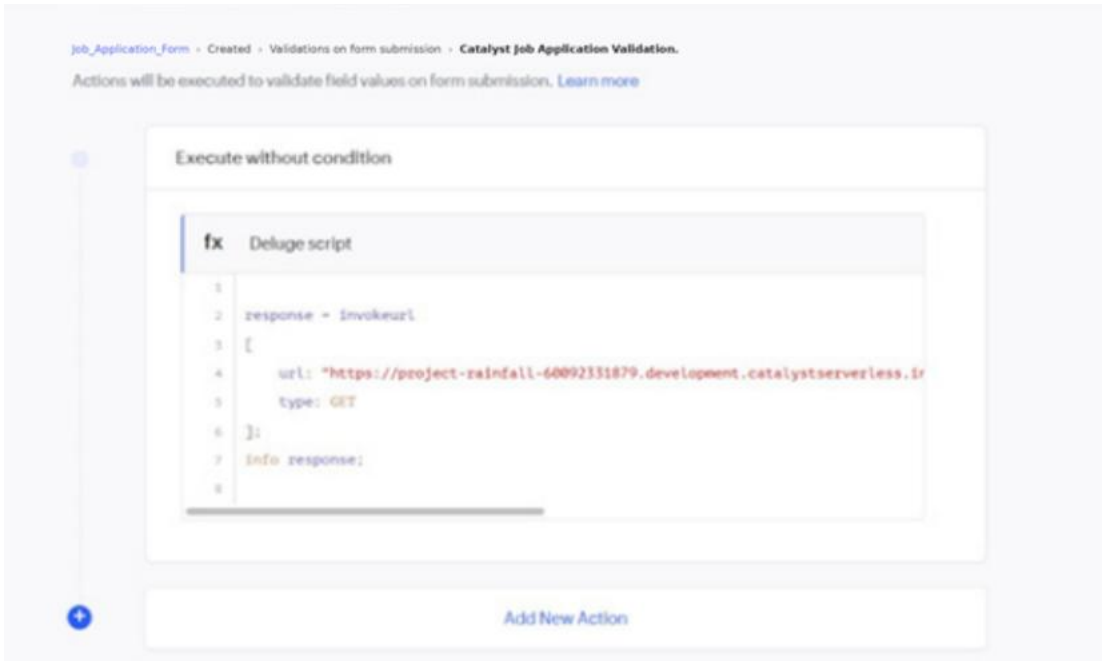

10. Added a Deluge script using invoke url to call the Catalyst serverless function.

Catalyst CLI enables you to develop, test, and deploy your applications directly from your terminal. Execute the given command in your terminal to install Catalyst CLI using npm.
Install Catalyst:
$ npm install -g zcatalyst-cli
To initialize a function from the CLI and create a directory for it on your system, execute the following Catalyst command in your terminal:
Init Functions:
$ catalyst init functions

APPLICATION

In the Job Application Management System, Zoho Catalyst extends backend functionality by validating candidate application details through a serverless function. The function checks whether the candidate name, email address, and job position are provided and returns an appropriate success or error message. The Catalyst endpoint can be integrated with Zoho Creator workflows to automate candidate validation and enhance recruitment processing.

RESULT

Successfully created and tested the candidate Application Validator serverless function in Zoho Catalyst using Node.js 24. The function validated sample candidate application details and returned the expected success or error messages. A Zoho Creator workflow was configured to call the Catalyst endpoint, demonstrating successful integration between Zoho Creator and Zoho Catalyst for the Job Application Management System.
