EXP 11: Application Deployment and Migration

AIM

To understand and execute the deployment and migration lifecycle of a Zoho Creator Job Application Management System by moving application components from the Development Environment to the Production Environment safely and efficiently.

OVERVIEW

Zoho Creator provides separate Development and Production environments to distinguish application development and testing from live usage. The deployment and migration process transfers application components such as forms, reports, workflows, pages, and configurations from the development environment to the production environment while maintaining data integrity and ensuring a smooth release.

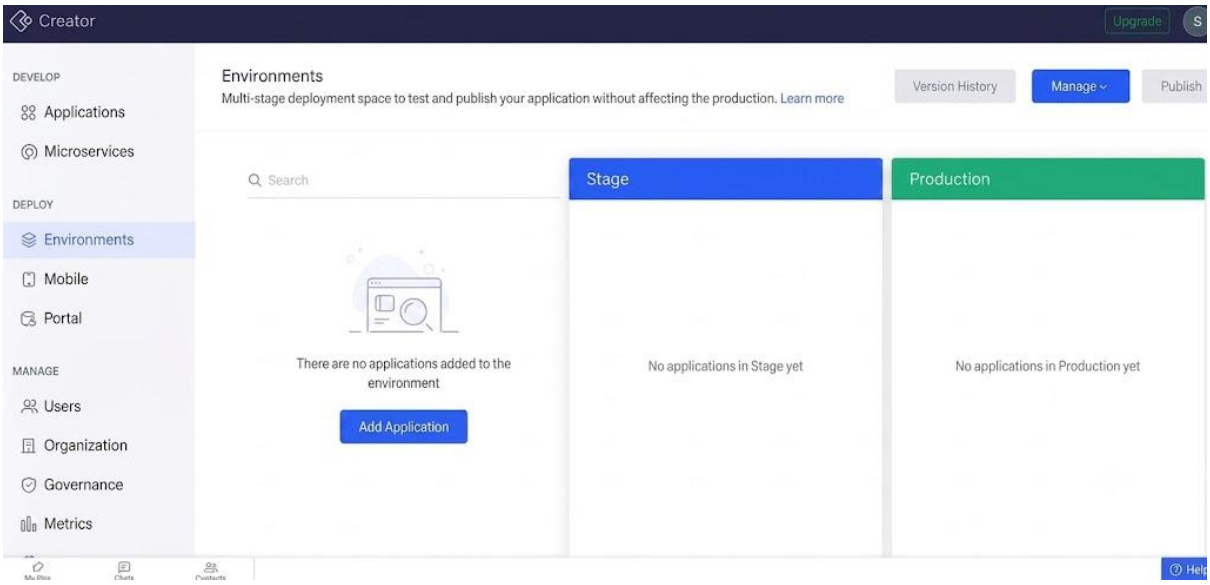

PROCEDURE: APPLICATION DEPLOYMENT IN ZOHO CREATOR

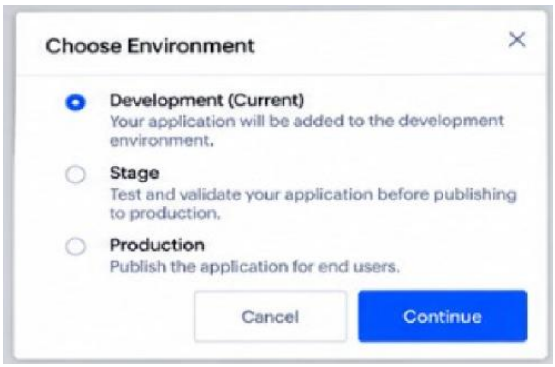

1. Log in to Zoho Creator and open the Job Application Management System in the Development environment.
2. Verify that all forms, reports, workflows, pages, and validations are functioning correctly before deployment.
3. Navigate to Deploy → Environments to access the application deployment interface.
4. Click Add Application, select the Job Application Management System, and choose the appropriate deployment environment.
5. Deploy the application to the Stage environment for testing.
6. Test candidate registration, job application submission, interview scheduling, reports, and email notification workflows.
7. Review all application components and verify that the staged version functions correctly.
8. After successful testing, select Publish → Deploy to Production and confirm the deployment.
9. Open the Production application and verify that forms, reports, workflows, pages, and data are working correctly for end users.

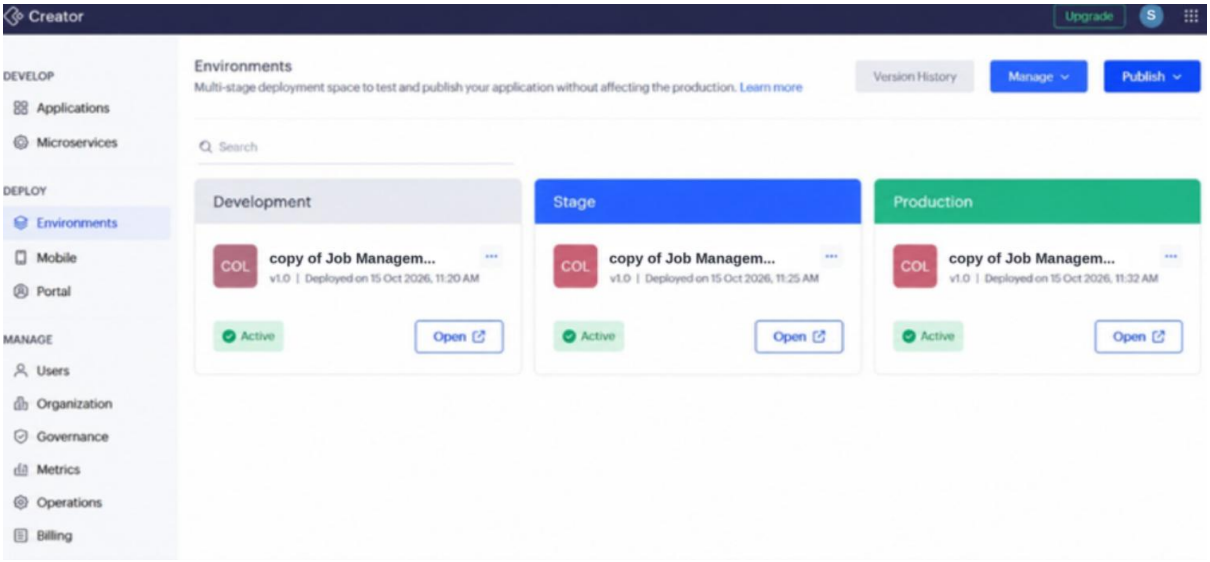

PROCEDURE: APPLICATION MIGRATION IN ZOHO CREATOR

1. Open the Job Application Management System in the source Zoho Creator account.

2. Open the application's three-dot menu and select Export, if available.
3. Select the required components, including forms, reports, workflows, pages, and application records.
4. Export the application and download the generated ZIP file.
5. Log in to the destination Zoho Creator account.
6. Select New Application → Import Application and upload the exported ZIP file.
7. Complete the import process by following the on-screen instructions.
8. Verify that forms, reports, workflows, pages, lookup fields, and records have been migrated successfully.
9. Test the imported application by submitting a sample job application and verify that reports and notification workflows function correctly.

RESULT

The deployment and migration procedures of the Job Application Management System in Zoho Creator were successfully studied. The process of transferring forms, reports, workflows, pages, and application data from the Development environment to the Production environment and between Zoho Creator accounts was completed successfully, ensuring proper functionality and data integrity.
