EXP 10: Performance Optimization in Zoho Creator

AIM

To study and implement performance optimization techniques in Zoho Creator to improve the speed and efficiency of the Job Application Management System by reducing loading time, optimizing workflows, improving data retrieval, and enhancing overall application performance.

PROBLEM STATEMENT

A company uses a Zoho Creator Job Application Management System to manage candidate applications, recruitment details, interview schedules, and employee referrals. As the number of applications increases, the application becomes slower because reports retrieve unnecessary records, workflows execute repeated actions, and Deluge scripts perform redundant database operations.

SOLUTION

- Apply filters to reports to display only relevant candidate application records.
- Remove repeated workflows and avoid unnecessary workflow triggers.
- Simplify Deluge scripts and reduce repeated database queries.
- Include only the required fields and validations in the Job Application Form.
- Retrieve only the required records and fields from the database.
- Test the application and compare its performance before and after optimization.

EXPECTED OBSERVATION

S. No.	Observation	Result
1	Initial application performance	Reports may load slowly.
2	Filters applied to reports	Only relevant candidate records are displayed.
3	Repeated workflows removed	Unnecessary workflow executions are reduced.
4	Deluge scripts optimized	Redundant database operations are minimized.

5	Application tested after optimization	Improved application efficiency is observed.

PROCEDURE

1. Log in to Zoho Creator and open the Job Application Management System.
2. Identify performance issues in forms, reports, workflows, and Deluge scripts.
3. Apply filters to reports to display only the required candidate application records.
4. Remove repeated workflows and optimize Deluge scripts.
5. Retrieve only the required records and fields from the database.
6. Test the application and compare its performance before and after optimization.

RESULT

Performance optimization techniques were successfully applied to the Job Application Management System. The optimization reduced unnecessary processing, improved report loading speed, enhanced workflow execution, and increased the overall efficiency of the application.

CONCLUSION

Thus, performance optimization in Zoho Creator was successfully studied. By optimizing reports, workflows, Deluge scripts, forms, and data retrieval, the Job Application Management System achieved improved performance, faster response time, and a better user experience.

Once Python is available again, I can also generate this in a professional lab-record PDF with proper headings, formatting, and tables.
