EXP 12: Security and Governance in Zoho Creator

AIM

To study and implement security and governance features in Zoho Creator to protect candidate information, control user access, and ensure secure management of the Job Application Management System.

PROBLEM STATEMENT

A company uses a Job Application Management System in Zoho Creator to manage candidate details, job applications, interview schedules, and recruitment information. Unauthorized access to sensitive candidate data could lead to data leakage, misuse, or unauthorized modifications.

SOLUTION

- Admin: Can manage users, candidate applications, recruitment details, and application settings.
- HR Manager: Can view and manage candidate applications, interview schedules, and recruitment records.
- Candidate: Can submit job applications and view only their own application details.
- Access Control: Configure permissions for forms, reports, pages, and records based on user roles.
- Data Protection: Restrict access to sensitive candidate information and uploaded documents.
- Monitoring: Review user permissions and monitor application access where available.

Expected Result: The Job Application Management System provides secure access to candidate data, protects sensitive information, and minimizes the risk of unauthorized access.

EXPECTED OBSERVATION

S. No.	Observation	Result
1	User roles created	Access categorized based on user roles.
2	Permissions configured	Unauthorized access is restricted.
3	Record-level access applied	Users can access only permitted records.

S. No.	Observation	Result
4	Different user roles tested	Access permissions are verified successfully.
5	Security settings reviewed	Application security is improved.

PROCEDURE

1. Log in to Zoho Creator and open the Job Application Management System.
2. Create user roles such as Admin, HR Manager, and Candidate.
3. Configure permissions to control access to forms, reports, pages, and records.
4. Set field-level permissions and record-level access rules.
5. Configure authentication and sharing settings to protect candidate information.
6. Test the application using different user roles.
7. Verify that each user can access only the data and features assigned to their role.

RESULT

Security and governance features were successfully implemented in the Job Application Management System. User roles, access permissions, and authentication settings helped protect candidate information and ensure secure application management.

CONCLUSION

Thus, security and governance in Zoho Creator were successfully studied. By implementing role-based access control, authentication, data protection, and access permissions, the Job Application Management System provides secure management of candidate information and recruitment processes.
